3. I was surprised to see that the computer programmer jobs are declining since many of the other jobs in similar fields are increasing. I was also interested to see that only 2 of the 9 jobs I looked at only required a Bachelor's degree.

4. Ranking from best to worst
    1. Software Developer
    2. Computer and Information Systems Managers
    3. Data Scientist
    4. Project Management Specialist
    5. Computer Programmers
    6. Mathematician and Statistician
    7. Computer and Information Research Scientist
    8. Sales Engineers
    9. Market Research Analysts

I chose this order based on my personal interests as well as the data I collected like degree required and job outlook. I am interested in roles that strongly align with my computer science major, but I am also minoring in data science and business so some more multidisciplinary jobs are exciting to me. I ranked computer programmer lower than I would have anticipated because it was the only job I looked at with a negative outlook. I also prioritized jobs that only required a Bachelor's degree because I want to find a job right out of college.
